

Test Execution Summary

#	Scenario	Result
1	Forgot Password – valid data <i>Password reset flow completes successfully with valid account data.</i>	✓ PASSED
2	Forgot Password – invalid data (non-existent customer) <i>Returns HTTP 200 instead of an error status for a customer that doesn't exist.</i>	✗ FAILED
3	Registration – duplicate Social Security Number <i>The system allows creating two separate accounts using the same SSN; it should be unique per user.</i>	✗ FAILED
4	Open New Account (Savings / Checking) <i>New account created successfully for both account types.</i>	✓ PASSED
5	Open New Account – funding amount exceeds source account balance <i>The new account is created successfully, but the source account balance goes negative instead of the transaction being rejected.</i>	✗ FAILED
6	Transfer Funds – transfer amount of \$0 <i>The system allows a \$0 transfer instead of rejecting it.</i>	✗ FAILED
7	Transfer Funds – transfer amount exceeds account balance <i>The transfer succeeds and the source account balance becomes negative instead of being rejected.</i>	✗ FAILED
8	Bill Pay <i>Amount is correctly deducted from the selected source account.</i>	✓ PASSED
9	Find Transactions – transaction ID ownership check <i>Returned transaction IDs do not match the account they belong to.</i>	✗ FAILED
10	Find Transactions – invalid transaction ID <i>Returns HTTP 500 (server error) instead of a proper handled error response.</i>	✗ FAILED
11	Find Transactions – search by valid Transaction ID, Amount, Date Range, or Date (including empty fields) <i>All search combinations return correct results.</i>	✓ PASSED
12	Update Contact Info – data exposure <i>Username and password are exposed in the request payload/query when updating contact info (security issue), even though the update itself succeeds and the new data is reflected immediately.</i>	✗ FAILED
13	Update Contact Info – update fails after logout/re-login <i>After logout/login, a repeat update returns 200 OK but data isn't persisted — GET still shows the old values, because the username and password fields are sent empty on the update request after re-login, which is why the update silently fails.</i>	✗ FAILED
14	Update Profile Info – incorrect confirmation message <i>The system always displays a message stating that address and phone number were updated, even when a different field (or none of those two) was the one actually changed.</i>	✗ FAILED
15	Transfer Funds – transfer to the same account <i>The system allows transferring money from an account to itself instead of rejecting it.</i>	✗ FAILED

#	Scenario	Result
16	Request Loan – input validation <i>The system does not validate that inputs are correct and sends them as empty query parameters instead of rejecting the request.</i>	✗ FAILED
17	Request Loan – Combined processor, Down Payment + Balance $\geq$ threshold <i>Loan: \$1000, Down Payment: \$100, Balance: \$100 (total \$200). Expected approval, but the loan was rejected.</i>	
18	Request Loan – Combined processor, Down Payment + Balance $<$ threshold <i>Loan: \$1000, Down Payment: \$100, Balance: \$99 (total \$199). Correctly rejected.</i>	✓ PASSED
19	Request Loan – Down Payment processor <i>Loan Amount: \$1000. Down Payment \$199 → Rejected. Down Payment \$200 → Approved.</i>
